<p>Cisco IOS XE 3.5</p> <p>Effective date of registration: 11/24/2014</p>	<p><b>Usage Guidelines</b> For additional notification types, see the Related Commands table for this command. <b>SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests for the specified notification types. To specify whether the notifications should be sent as traps or informs, use the <code>snmp-server host [traps   informs]</code> command.</b></p> <p>If you do not enter an <code>snmp-server enable traps</code> command, no notifications controlled by this command are sent. In order to configure the router to send these SNMP notifications, you must enter at least one <code>snmp-server enable traps</code> command. If you enter the command with no keywords, all notification types are enabled. If you enter the command with a keyword, only the notification type related to that keyword is enabled. In order to enable multiple types of notifications, you must issue a separate <code>snmp-server enable traps</code> command for each notification type and notification option.</p> <p>The <code>snmp-server enable traps</code> command is used in conjunction with the <code>snmp-server host</code> command. Use the <code>snmp-server host</code> command to specify which host or hosts receive SNMP notifications. In order to send notifications, you must configure at least one <code>snmp-server host</code> command.</p> <p>Cisco IOS Configuration Fundamentals and Network Management Command Reference (2004), at 1034; <i>see also</i> Cisco IOS Asynchronous Transfer Mode Command Reference (2011), at 535.</p>	<p><b>snmp-server enable traps</b></p> <p>The <code>snmp-server enable traps</code> command enables the transmission of Simple Network Management Protocol (SNMP) notifications as traps or inform requests. This command enables both traps and inform requests for the specified notification types. The <code>snmp-server host</code> command specifies the notification</p> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1990.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1918; Arista User Manual v. 4.12.3 (7/17/13), at 1680; Arista User Manual, v. 4.11.1 (1/11/13), at 1365; Arista User Manual v. 4.10.3 (10/22/12), at 1132; Arista User Manual v. 4.9.3.2 (5/3/12), at 888; Arista User Manual v. 4.8.2 (11/18/11), at 696; Arista User Manual v. 4.7.3 (7/18/11), at 552.</p>

Cisco IOS 15.2  Effective date of registration: 11/24/2014	<p><b>Usage Guidelines</b></p> <p>Use the <b>ip multicast multipath</b> command to enable load splitting of IP multicast traffic across multiple equal-cost paths.</p> <p>If two or more equal-cost paths from a source are available, unicast traffic will be load split across those paths. However by default, multicast traffic is not load split across multiple equal-cost paths. In general, multicast traffic flows down from the reverse path forwarding (RPF) neighbor. According to the Protocol Independent Multicast (PIM) specifications, this neighbor must have the highest IP address if more than one neighbor has the same metric.</p> <p>Configuring load splitting with the <b>ip multicast multipath</b> command causes the system to load split multicast traffic across multiple equal-cost paths based on source address using the S-hash algorithm. When the <b>ip multicast multipath</b> command is configured and multiple equal-cost paths exist, the path in which multicast traffic will travel is selected based on the source IP address. Multicast traffic from different sources will be load split across the different equal-cost paths. Load splitting will not occur across equal-cost paths for multicast traffic from the same source sent to different multicast groups.</p> <p>Cisco IOS IP Multicast Command Reference (2011), at 293.</p>	<p>23.3.2 Equal Cost Multipath Routing (ECMP) and Load Sharing</p> <p>Multiple routes that have identical destinations and administrative distances comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread traffic to all ECMP route paths equally.</p> <p>If two or more equal-cost paths from a source are available, unicast traffic is load split across those paths. By default, multicast traffic is not load split. Multicast traffic generally flows from the reverse path forwarding (RPF) neighbor and, according to Protocol Independent Multicast (PIM) specifications, the neighbor with the highest IP address has precedence when multiple neighbors have the same metric.</p> <p>Arista User Manual v. 4.13.6F (4/14/2014), at 1191.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 1042; Arista User Manual, v. 4.11.1 (1/11/13), at 398; Arista User Manual v. 4.10.3 (10/22/12), at 320.</p>
Cisco IOS 15.2  Effective date of registration: 11/24/2014	<p><b>Usage Guidelines</b></p> <p>Use the <b>ip multicast boundary</b> command to configure an administratively scoped boundary on an interface in order to filter source traffic coming into the interface and prevent mroute states from being created on the interface.</p> <p><b>Note</b></p> <p>An IP multicast boundary enables reuse of the same <b>multicast group address</b> in different administrative <b>domains</b>.</p> <p>Cisco IOS IP Multicast Command Reference (2011), at 264.</p>	<p><b>Multicast Boundary Configuration</b></p> <p>The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). Multicast pim, igmp or data packets are not allowed to flow across the boundary from either direction. The boundary facilitates the use of a <b>multicast group address</b> in different administrative <b>domains</b>.</p> <p>The <b>ip multicast boundary</b> command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.</p> <p>Arista User Manual v. 4.13.6F (4/14/2014), at 1704.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 1482; Arista User Manual, v. 4.11.1 (1/11/13), at 1184; Arista User Manual v. 4.10.3 (10/22/12), at 1018; Arista User Manual v. 4.9.3.2 (5/3/12), at 776.</p>

Cisco IOS 15.0  Effective Date of Registration: 11/28/2014	<p><b>Usage Guidelines</b></p> <p>Enabling PIM on an interface also enables Internet Group Management Protocol (IGMP) operation on that interface. An interface can be configured to be in dense mode, sparse mode, or sparse-dense mode. The mode describes how the Cisco IOS software populates its multicast routing table and how the software forwards multicast packets it receives from its directly connected LANs. Dense mode interfaces are always added to the table when the multicast routing table is populated. Sparse mode interfaces are added to the table only when periodic join messages are received from downstream routers, or there is a directly connected member on the interface.</p> <p>Cisco IOS IP Multicast Command Reference (2008), at IMC-233–34</p>	<p>33.3.1 Enabling IGMP</p> <p>Enabling PIM on an interface also enables IGMP on that interface. When the switch populates the multicast routing table, interfaces are added to the table only when periodic join messages are received from downstream routers, or when there is a directly connected member on the interface.</p> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1778.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1726; Arista User Manual v. 4.12.3 (7/17/13), at 1504; Arista User Manual, v. 4.11.1 (1/11/13), at 1204; Arista User Manual v. 4.10.3 (10/22/12), at 998; Arista User Manual v. 4.9.3.2 (5/3/12), at 756; Arista User Manual v. 4.8.2 at 578; Arista User Manual v. 4.7.3 (7/18/11), at 458; Arista User Manual v. 4.6.0 (12/22/2010), at 308</p>
Cisco IOS 15.2  Effective date of registration: 11/24/2014	<p><b>Usage Guidelines</b></p> <p>SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests for the specified notification types. PIM notifications are defined in the CISCO-PIM-MIB.mib and PIM-MIB.mib files, available from Cisco.com at <a href="http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml">http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml</a>.</p> <p>Cisco IOS IP Multicast Command Reference (2011), at 742</p>	<p><b>SNMP Commands</b></p> <p><b>snmp-server enable traps</b></p> <p>The <code>snmp-server enable traps</code> command enables the transmission of Simple Network Management Protocol (SNMP) notifications as traps or inform requests. This command enables both traps and inform requests for the specified notification types. The <code>snmp-server host</code> command specifies the notification type (traps or informs). Cisco IOS 15.2  Effective date of registration: 11/24/2014	<p><b>Usage Guidelines</b></p> <p>The local proxy ARP feature allows the Multilayer Switching Feature Card (MSFC) to respond to ARP requests for IP addresses within a subnet where normally no routing is required. With the local proxy ARP feature enabled, the MSFC responds to all ARP requests for IP addresses within the subnet and forwards all traffic between hosts in the subnet. Use this feature only on subnets where hosts are intentionally prevented from communicating directly to the Catalyst 6500 series switch on which they are connected.</p> <p>Before the local proxy ARP feature can be used, the IP proxy ARP feature must be enabled. The IP proxy ARP feature is enabled by default.</p> <p>Cisco IOS IP Addressing Services Command Reference (2011), at 394</p>	<p><b>ip local-proxy-arp</b></p> <p>The ip local-proxy-arp command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. Local proxy ARP programs the switch to respond to ARP requests for IP addresses within a subnet where routing is not normally required. A typical local proxy arp application is supporting isolated private VLANs that communicate with each other by routing packets.</p> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1276.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1231; Arista User Manual v. 4.12.3 (7/17/13), at 1073; Arista User Manual, v. 4.11.1 (1/11/13), at 856; Arista User Manual v. 4.10.3 (10/22/12), at 707.</p>
Cisco IOS 15.2  Effective date of registration: 11/24/2014	<p><b>Usage Guidelines</b></p> <p>IP uses a 32-bit mask that indicates which address bits belong to the network and subnetwork fields, and which bits belong to the host field. This is called a <i>netmask</i>. By default, show commands display an IP address and then its netmask in dotted decimal notation. For example, a subnet would be displayed as 10.108.11.0 255.255.255.0.</p> <p>Cisco IOS IP Addressing Services Command Reference (2011), at 452</p>	<ul style="list-style-type: none"> <li>• <b>SUBNET_SIZE</b> this functions as a sanity check to ensure it is not a network or broadcast network. Options include: <ul style="list-style-type: none"> <li>— <b>netmask <i>IPv4_addr</i></b> The network mask that indicates which address bits belong to the network and subnetwork fields and which bits belong to the host field. Specify the netmask of the network to which the pool addresses belong (dotted decimal notation).</li> </ul> </li> </ul> <p>Arista User Manual v. 4.13.6F (4/14/2014), at 1233.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 1075.</p>

Cisco IOS 12.4  Effective date of registration: 8/12/2005	<p><b>Route Target Extended Community Attribute</b> The <b>route target (RT)</b> extended community attribute is configured with the <b>rt</b> keyword. This attribute is used to identify a set of sites and VRFs that may receive routes that are tagged with the configured route target. Configuring the route target extended attribute with a route allows that route to be placed in the per-site forwarding tables that are used for routing traffic that is received from corresponding sites.</p> <p><b>Site of Origin Extended Community Attribute</b> The <b>site of origin (SOO)</b> extended community attribute is configured with the <b>soo</b> keyword. This attribute uniquely identifies the site from which the provider edge (PE) router learned the route. All routes learned from a particular site must be assigned the same site of origin extended community attribute, regardless if a site is connected to a single PE router or multiple PE routers. Configuring this attribute prevents routing loops from occurring when a site is multihomed. The SOO extended community attribute is configured on the interface and is propagated into BGP through redistribution. The SOO should not be configured for stub sites or sites that are not multihomed.</p> <p><b>IP Extended Community-List Configuration Mode</b> Named and numbered extended community lists can be configured in IP Extended community-list configuration mode. To enter IP Extended community-list configuration mode, enter the <b>ip extcommunity-list</b> command with either the <b>expanded</b> or <b>standard</b> keyword followed by the extended community list name. This configuration mode supports all of the functions that are available in global configuration mode. In addition, you can perform the following operations:</p> <p>Cisco IOS IP Routing Protocols Command Reference, Release 12.4 (2005), at IRP-118</p>	<p><b>ip extcommunity-list expanded</b></p> <p>The <b>ip extcommunity-list expanded</b> command creates an extended community list to configure Virtual Private Network (VPN) route filtering. Extended community attributes filter routes for virtual routing and forwarding instances (VRFs). The command uses regular expressions to name the communities specified by the list.</p> <ul style="list-style-type: none"> <li>• <b>Route Target (rt)</b> attribute identifies a set of sites and VRFs that may receive routes that are tagged with the configured route target. <p>Cisco IOS 15.2</p> <p>Effective date of registration: 11/24/2014</p>	<p>SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the sender never receives the response, the inform request can be sent again. Thus, informs are more likely than traps to reach their intended destination.</p> <p>Compared to traps, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Also, traps are sent only once; an inform may be tried several times. The retries increase traffic and contribute to a higher overhead on the network.</p> <p>If you do not enter an <b>snmp-server host</b> command, no notifications are sent. To configure the router to send SNMP notifications, you must enter at least one <b>snmp-server host</b> command. If you enter the command with no optional keywords, all trap types are enabled for the host.</p> <p>To enable multiple hosts, you must issue a separate <b>snmp-server host</b> command for each host. You can specify multiple notification types in the command for each host.</p> <p>Cisco IOS IP Switching Command Reference (2011), v. 15.2, at 542</p>	<p>37.2.2 SNMP Notifications</p> <p>SNMP notifications are messages, sent by the agent, to inform managers of an event or a network condition. A <i>trap</i> is an unsolicited notification. An <i>inform</i> (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.</p> <p>Traps are less reliable than informs because the receiver does not send any acknowledgment. However, traps are often preferred because informs consume more switch and network resources. A trap is sent only once and is discarded as soon as it is sent. An inform request remains in memory until a response is received or the request times out. An inform may be retried several times, increasing traffic and contributing to higher network overhead.</p> <p>Table 37-2 lists the SNMP traps that the switch supports.</p> <p>Arista User Manual v. 4.14.3F (Rev. 2) (10/2/2014), at 1963.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1891; Arista User Manual v. 4.12.3 (7/17/13), at 1653; Arista User Manual, v. 4.11.1 (1/11/13), at 1341; Arista User Manual v. 4.10.3 (10/22/12), at 1107; Arista User Manual v. 4.9.3.2 (5/3/12), at 863; Arista User Manual v. 4.8.2 at 675; Arista User Manual v. 4.7.3 (7/18/11), at 531.</p>

However, traps are often preferred because informs consume more switch and network resources. A trap is sent only once and is discarded as soon as it is sent. An inform request remains in memory until a response is received or the request times out. An inform may be retried several times, increasing traffic and contributing to higher network overhead.</p> <p>Arista User Manual v. 4.14.3F (Rev. 2) (10/2/2014), at 1963.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1891; Arista User Manual v. 4.12.3 (7/17/13), at 1653; Arista User Manual, v. 4.11.1 (1/11/13), at 1341; Arista User Manual v. 4.10.3 (10/22/12), at 1107; Arista User Manual v. 4.9.3.2 (5/3/12), at 863; Arista User Manual v. 4.8.2 at 675; Arista User Manual v. 4.7.3 (7/18/11), at 531.</p>

Syntax Description	auto									
	Determines authentication status of the client PC by the authentication process. The port state will be set to AUTO.									
	<b>force-authorized</b> Disables 802.1X on the interface and causes the port to change to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client. The <b>force-authorized</b> keyword is the default.									
	<b>force-unauthorized</b> Denies all access through this interface by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate.

<p>Cisco NX-OS 4.0</p> <p>Effective Date of registration: 11/13/2014</p>	<p>Rapid per VLAN Spanning Tree Plus (Rapid PVST+) and Multiple Spanning Tree (MST) have built-in compatibility mechanisms that allow them to interact properly with other versions of IEEE spanning tree or other regions. For example, a bridge running Rapid PVST+ can send 802.1D bridge protocol data units (BPDUs) on one of its ports when it is connected to a legacy bridge. An MST bridge can detect that a port is at the boundary of a region when it receives a legacy BPDU or an MST BPDU that is associated with a different region.</p> <p>These mechanisms are not always able to revert to the most efficient mode. For example, a Rapid PVST+ bridge that is designated for a legacy 802.1D bridge stays in 802.1D mode even after the legacy bridge has been removed from the link. Similarly, an MST port assumes that it is a boundary port when the bridges to which it is connected have joined the same region.</p> <p>To force the MST port to renegotiate with the neighbors, enter the <code>clear spanning-tree detected-protocol</code> command.</p> <p>If you enter the <code>clear spanning-tree detected-protocol</code> command with no arguments, the command is applied to every port of the device.</p> <p>This command does not require a license.</p> <p>Cisco NX-OS Layer 2 Switching Command Reference (2008), Release 4.0, at L2-5.</p>	<p>20.2.1.4 <b>Version Interoperability</b></p> <p>A network can contain switches running different spanning tree versions. The common spanning tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.</p> <p>In multi-instance topologies, the following instances correspond to the CST:</p> <ul style="list-style-type: none"> <li>• Rapid-PVST: VLAN 1</li> <li>• MST: IST (instance 0)</li> </ul> <p>RSTP and MSTP are compatible with other spanning tree versions:</p> <ul style="list-style-type: none"> <li>• An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.</li> <li>• RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.</li> <li>• An MST bridge can detect that a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.</li> <li>• MST ports assume they are boundary ports when the bridges to which they connect join the same region.</li> </ul> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 953.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 831; Arista User Manual, v. 4.11.1 (1/11/13), at 649; Arista User Manual v. 4.10.3 (10/22/12), at 563; Arista User Manual v. 4.9.3.2 (5/3/12), at 483; Arista User Manual v. 4.8.2 (11/18/11), at 357; Arista User Manual v. 4.7.3 (7/18/11), at 231.</p>
<p>Cisco NX-OS 4.0</p> <p>Effective Date of registration: 11/13/2014</p>	<p>When you enable this BPDU Guard command globally, the command applies only to spanning tree edge ports. See <a href="#">spanning-tree port type edge bpduguard default</a> for more information on the global command for BPDU Guard. However, when you enable this feature on an <i>interface</i>, it applies to that interface <i>regardless</i> of the spanning tree port type.</p> <p>This command has three states:</p> <ul style="list-style-type: none"> <li>• <code>spanning-tree bpduguard enable</code>—Unconditionally enables BPDU Guard on the interface.</li> <li>• <code>spanning-tree bpduguard disable</code>—Unconditionally disables BPDU Guard on the interface.</li> <li>• <code>no spanning-tree bpduguard</code>—Enables BPDU Guard on the interface if it is an operational spanning tree edge port and if the <a href="#">spanning-tree port type edge bpduguard default</a> command is configured.</li> </ul> <p>Cisco NX-OS Layer 2 Switching Command Reference (2008), Release 4.0, at L2-31.</p>	<p>The <code>spanning-tree bpduguard</code> interface configuration command controls BPDU guard on the configuration mode interface. This command takes precedence over the default setting configured by <code>spanning-tree portfast bpduguard default</code>.</p> <ul style="list-style-type: none"> <li>• <code>spanning-tree bpduguard enable</code> enables BPDU guard on the interface.</li> <li>• <code>spanning-tree bpduguard disable</code> disables BPDU guard on the interface.</li> <li>• <code>no spanning-tree bpduguard</code> reverts the interface to the default BPDU guard setting.</li> </ul> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 968.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 847; Arista User Manual, v. 4.11.1 (1/11/13), at 665; Arista User Manual v. 4.10.3 (10/22/12), at 579; Arista User Manual v. 4.9.3.2 (5/3/12), at 498; Arista User Manual v. 4.8.2 (11/18/11), at 372; Arista User Manual v. 4.7.3 (7/18/11), at 246.</p>

Cisco NX-OS 4.0  Effective Date of registration: 11/13/2014	<p>The <code>cluster-id</code> command is used to assign a cluster ID to a route reflector when the cluster has one or more route reflectors. Multiple route reflectors are deployed in a cluster to increase redundancy and avoid a single point of failure. When multiple route reflectors are configured in a cluster, the same cluster ID is assigned to all route reflectors. This allows all route reflectors in the cluster to recognize updates from peers in the same cluster and reduces the number of updates that need to be stored in BGP routing tables.</p> <p>Cisco NX-OS Unicast Routing Command Reference (2008), Release 4.0, at L3-564.</p>	<p>When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information. Multiple route reflectors can be configured in the same cluster to increase redundancy and avoid a single point of failure. Each route reflector has a cluster ID. If the cluster has a single route reflector, the cluster ID is its router ID. If a cluster has multiple route reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster. All of them must be configured with the same cluster ID so that they can recognize updates from other route reflectors in the same cluster. The <code>bgp cluster-id</code> command configures the cluster ID in a cluster with multiple route reflectors.</p> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1549.</p> <p>See also Arista User Manual v. 4.12.3 (7/17/13), at 1331; Arista User Manual, v. 4.11.1 (1/11/13), at 1081; Arista User Manual v. 4.10.3 (10/22/12), at 893; Arista User Manual v. 4.9.3.2 (5/3/12), at 665.</p>

<p>Cisco NX-OS 4.0</p> <p>Effective Date of registration: 11/13/2014</p>	<p><b>IS-IS Overview</b></p> <p>IS-IS sends a <i>hello packet</i> out every configured interface to discover IS-IS neighbor routers. The hello packet contains information, such as the authentication, area, and supported protocols, which the receiving interface uses to determine compatibility with the originating interface. Compatible interfaces form adjacencies, which update routing information in the link-state database through link-state update messages (LSPs). By default, the router sends a periodic LSP refresh every 10 minutes and the LSPs remain in the link-state database for 20 minutes (the LSP lifetime). If the router does not receive an LSP refresh before the end of the LSP lifetime, the router deletes the LSP from the database.</p> <p>The LSP interval must be less than the LSP lifetime or the LSPs time out before they are refreshed.</p> <p><b>IS-IS Areas</b></p> <p>You can design IS-IS networks as a single area that includes all routers in the network or as multiple areas that connect into a backbone or Level 2 area. Routers in a nonbackbone area are Level 1 routers which establish adjacencies within a local area (intra-area routing). Level 2 area routers establish adjacencies to other Level 2 routers and perform routing between Level 1 areas (inter-area routing). A router can have both Level 1 and Level 2 areas configured. These Level 1/Level 2 routers act as area border routers which route information from the local area to the Level 2 backbone area (see Figure 8-1).</p> <p>Within a Level 1 area, routers know how to reach all other routers in that area. Between areas, routers know how to reach the area border router to get to the Level 2 area. The Level 2 routers know how to reach other area border routers and other Level 2 routers. Level 1/Level 2 routers straddle the boundary between two areas, routing traffic to and from the Level 2 backbone area.</p> <p>Each IS-IS instance in Cisco NX-OS supports either a single Level 1 or Level 2 area, or one of each. By default, all IS-IS instances automatically support Level 1 and Level 2 routing.</p> <p>Cisco NX-OS Unicast Routing Configuration Guide, Release 4.0, at 8-2.</p>	<p><b>29.2 IS-IS Description</b></p> <p>IS-IS sends a hello packet out every configured interface to discover IS-IS neighbor routers. The hello packet contains information, which the receiving interface uses to determine compatibility with the originating interface. Compatible interfaces form adjacencies, which update routing information in the link-state database through link-state update messages (LSPs). If the router does not receive an LSP refresh before the end of the LSP lifetime, the device deletes the LSP from the database.</p> <p><b>Terms of IS-IS Routing Protocol</b></p> <p>The following terms are used when configuring IS-IS.</p> <ul style="list-style-type: none"> <li>NET and System ID – Each IS-IS instance has an associated network entity title (NET). The NET consists of the IS-IS system ID, which uniquely identifies the IS-IS instance in the area and the area ID.</li> <li>Designated Intermediate System – IS-IS uses a Designated Intermediate System (DIS) in broadcast networks to prevent each device from forming unnecessary links with every other device on the broadcast network. IS-IS devices send LSPs to the DIS, which manages all the link-state information for the broadcast network. You can configure the IS-IS priority that IS-IS uses to select the DIS in an area.</li> <li>IS-IS Areas – You can design IS-IS networks as a single area that includes all routers in the network or as multiple areas that connect into a backbone or Level 2 area. Routers in a nonbackbone area are Level 1 routers that establish adjacencies within a local area (intra-area routing). Level 2 area routers establish adjacencies to other Level 2 routers and perform routing between Level 1 areas (inter-area routing). A router can have both Level 1 and Level 2 areas configured.</li> <li>IS-IS Instances – Arista supports only one instance of the IS-IS protocol that runs on the same node.</li> <li>LSP – Link state packet (LSP) can switch link state information. LSPs fall into two types: Level 1 LSPs and Level 2 LSPs. Level 2 devices transmit Level 2 LSPs; Level-1 devices transmit Level 1 LSPs; Level 1-2 devices transmit both Level 2 LSPs and Level 1 LSPs.</li> <li>Hello packets – Hello packets, can establish and maintain neighbor relationships.</li> <li>Overload Bit – IS-IS uses the overload bit to tell other devices not to use the local router to forward traffic but to continue routing traffic destined for that local router. Possible conditions for setting the overload bit the device is in a critical condition.</li> </ul> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1674.</p> <p><i>See also</i> Arista User Manual v. 4.12.3 (7/17/13), at 1436.</p>

Command	Description									
<code>show ip mfib</code>	Displays the forwarding entries and interfaces in the IPv4 MFIB.									
<code>show ip mfib active</code>	Displays information from the IPv4 MFIB about the rate at which active multicast sources are sending to multicast groups.									
<code>show ip mfib count</code>	Displays a summary of traffic statistics from the IPv4 MFIB about multicast sources and groups.

Cisco IOS 15.4 Effective date of registration: 11/26/2014	<p>Enabling PIM on an interface also enables Internet Group Management Protocol (IGMP) operation on that interface. An interface can be configured to be in <b>dense mode</b>, <b>passive mode</b>, <b>sparse mode</b>, or <b>sparse-dense mode</b>. The mode describes how the Cisco IOS software populates its multicast routing table and how the software forwards multicast packets that it receives from its directly connected LANs. Dense mode interfaces are always added to the table when the multicast routing table is populated. Sparse mode interfaces are added to the table only when periodic join messages are received from downstream routers, or there is a directly connected member on the interface.</p> <p>Cisco IOS Multicast Command Reference (2013), at 330.</p>	<p><b>Enabling IGMP</b></p> <p>Enabling PIM on an interface also enables IGMP on that interface. When the switch populates the multicast routing table, interfaces are added to the table only when periodic join messages are received from downstream routers, or when there is a directly connected member on the interface.</p> <p>By default, PIM and IGMP are disabled on an interface. The <code>ip pim sparse-mode</code> command enables PIM and IGMP on the configuration mode interface.</p> <p>Arista User Manual v. 4.14.3F - Rev. 2 (10/2/14), at 1778.</p> <p><i>See also</i> Arista User Manual v. 4.13.6F (4/14/2014), at 1726; Arista User Manual v. 4.12.3 (7/17/13), at 1504; Arista User Manual, v. 4.11.1 (1/11/13), at 1204; Arista User Manual v. 4.10.3 (10/22/12), at 998; Arista User Manual v. 4.9.3.2 (5/3/12), at 756; Arista User Manual v. 4.8.2 at 578; Arista User Manual v. 4.7.3 (7/18/11), at 458; Arista User Manual v. 4.6.0 (12/22/2010), at 308.</p>
